User guide

Status

Overall this PC is performing above expectations (62nd percentile). This means that out of 100 PCs with exactly the same components, 38 performed better. The overall percentile is the average of the percentiles for each component in the PC.

Processor

With a below average single core score, this CPU can handle email, web browsing and audio/video playback but it will struggle to handle modern 3D games or workstation tasks such as video editing. Finally, with a gaming score of 34.1%, this CPU's suitability for 3D gaming is below average.

Graphics

4.93% is too low to play 3D games or use CAD packages. (Note: general computing tasks don't require 3D graphics)

Boot Drive

The boot partition is located on a mechanical or hybrid drive. Moving the system to an SSD will yield far faster boot times, better system responsiveness and faster application load times.

Memory

4GB is enough RAM to run any version of Windows and although it's sufficient for most games, some will benefit from up to 8GB of RAM. 4GB is also enough for modest file and system caches which allow for a responsive system.

OS Version

Although Windows 7 is still a viable option, it's now 7 years and 5 months old. This system should be upgraded to Windows 10 which is generally faster and has an improved set of core utilities including better versions of explorer and task manager.
